

Ostrum SRI Euro Bonds 3-5

FUND FACTSHEET

MARKETING COMMUNICATION - EXCLUSIVELY FOR PROFESSIONAL INVESTORS OR NON-PROFESSIONALS INVESTED IN THE FUND ⁽¹⁾

SHARE CLASS: GP/N (EUR) - FR0013241031

September 2025

Fund highlights

- Fund accredited with the French state SRI label and 100% invested in supranational and government bonds, including sovereign green bonds, issued or guaranteed by Eurozone countries with diversification in OECD issuers ex-EU [-10;+10].
- An ESG-based opportunistic approach seeking to add value through active duration management (range between [2; 5]), yield curve positioning, country allocation and diversification in inflation-linked bonds, supranationals and agencies.
- Issuers selected based on proprietary and independent fundamental research for sovereign and government-related issuers, considering materiality of ESG factors; process integrating SRI ratings for each instrument and ESG performance indicators.
- Promotes environmental, social and governance (ESG) criteria without setting sustainability as a fund objective. It may invest partly in assets with a sustainability objective, e.g. as defined by EU classification.
- Minimum proportion of taxonomy alignment: 0%
- Minimum proportion of sustainable investments: 40%
- SFDR Classification : Art. 8

RISK PROFILE

Lower risk	1	2	3	4	5	6	7	Higher risk
------------	---	---	---	---	---	---	---	-------------

The category of the summary risk indicator is based on historical data.

Due to its exposure to fixed income markets, the Fund may experience medium volatility, as expressed by its rank on the above scale.

The Fund investment policy exposes it primarily to the following risks:

- Counterparty risk
- Credit risk
- Risk related to the commitment on forward financial instruments
- Risk of holding securities with a low or no credit rating

The Fund is subject to sustainability risks.

For more information, please refer to the section detailing specific risks at the end of this document.

Some recent performance may be lower or higher. As the value of the capital and the returns change over time (notably due to currency fluctuations), the repurchase price of the shares can be higher or lower than their initial price. The performance indicated is based on the NAV (net asset value) of the share class, and is net of all charges applying to the fund but does not account for sale commissions, taxation or paying agent fees, and assumes that dividends if any are reinvested. Taking such fees or commissions into account would lower the returns. The performance of other share classes would be higher or lower based on the differences between the fees and the entry charges. In the periods where certain share classes are not subscribed or not yet created (inactive share classes), performance is calculated based on the actual performance of an active share class of the fund whose characteristics are considered by the management company as being closest to the inactive share class concerned, after adjusting it for the differences between the total expense ratios (TER), and converting any net asset value of the active share class in the currency in which the inactive share class is listed. The performance given for the inactive share class is the result of a calculation provided for information.

Please read the important information given in the additional notes at the end of this document.

⁽¹⁾ Please refer to the prospectus of the fund and to the KID before making any final investment decisions.

Source: Trucost

Ostrum AM uses Trucost to obtain all carbon intensities for corporates and sovereigns. To obtain this data, Trucost collects greenhouse gas emissions through a variety of public sources, such as company financial reports, environmental data sources and data published on company websites or other public sources. Where no published data is available, Trucost's Extended Environmental Input-Output (EEIO) model combines industry-specific environmental impact data with quantitative macroeconomic data on the flow of goods and services between different sectors of the economy to obtain an estimated carbon emissions figure. Once the intensity of each emitter has been obtained, each portfolio's carbon intensity is calculated by summing the intensity of each emitter, weighted by its contribution to the portfolio. This figure corresponds to the Weighted Average Carbon Intensity (WACI), as recommended by the TCFD. Carbon intensity measures the volume of carbon emissions per dollar of turnover generated by the issuers in the portfolio over a given period. Further information on the methodology is available here: <https://www.spglobal.com/spdji/en/documents/additional-material/faq-trucost.pdf>

1. Carbon intensity is the volume of CO₂ emitted per \$1 million of GDP generated. To calculate it, we take into account the greenhouse gas (GHG) emissions of a State or of a quasi-sovereign issuer, including land distribution, land use change and forestry, as reported by PRIMAP.

Carbon intensity of a State (or a quasi-sovereign issuer): (tons of CO₂ / Millions of dollars of GDP) = (Carbon Emissions) / Millions of dollars of GDP.

2. The portfolio's average carbon intensity is the sum of the carbon intensities of the States (or quasi-sovereign issuers), weighted according to their share in the portfolio.

3. The calculation of the portfolio's average carbon intensity only considers the securities of sovereign issuers and quasi-sovereign issuers held in our internal funds.

4. Represents the % contribution of the State or quasi-sovereign issuer to the average carbon intensity of the portfolio.

5. Represents the number of millions of tons of CO₂ equivalent emitted by the issuer for its share of debt held in the portfolio. The Carbon Emissions of a State or quasi-sovereign issuer take into account its greenhouse gas (GHG) emissions, including land use, land use change and forestry as reported by PRIMAP.

PRIMAP is a database combining multiple sovereign carbon emissions datasets, published to create a comprehensive set of greenhouse gas emission trajectories for most countries in the UNFCCC (United Nations Framework Convention on Climate Change) as well as non-UNFCCC countries from 1850 onwards. This data represents the main greenhouse gas categories of the 2006 IPCC - Intergovernmental Panel on Climate Change (CO₂, CH₄, N₂O, etc.) Further information is available here: <http://doi.org/10.5880/PIK.2016.003>. Trucost is a data provider.

Ostrum SRI Euro Bonds 3-5

Portfolio analysis as of 30/09/2025

FUND MANAGER'S COMMENT

In the United States, second-quarter GDP growth was revised upwards to 3.8%. This positive figure masks highly uneven growth, driven mainly by developments in AI. Excluding the technology sector, activity was modest. Household consumption was nevertheless better than expected during this period of weak employment and rising inflation, which accelerated to 2.9% in August. The labour market is showing signs of deterioration, with job creation limited to 22k in August 2025. The unemployment rate rose slightly by 0.1 percentage point to 4.3%. However, job vacancies improved with an increase of 19k, although the three- and six-month trends remain negative. The ISM surveys show that manufacturing activity is still weak (48.7) but improving slightly, while the services sector remains more buoyant, with a PMI of 52 in August. Against this backdrop, the Fed, under pressure from the Trump administration, cut its rate by 25bp while signalling further adjustments to come, even as it raised its inflation and growth expectations for 2026. In China, economic indicators show a mixed picture. The manufacturing PMI, although in contraction territory at 49.8, showed a slight improvement on the previous month. Retail sales disappointed with a 3.4% year-on-year rise, and industrial production also slowed to 5.2%. Very low inflation, both at the consumer and producer levels, remains a concern, which could also be a sign of weak domestic demand. Industrial earnings nevertheless rebounded in August (+20.4%), highlighting the challenges of the anti-involution policy aimed at reducing industrial overcapacity. The Eurozone posted a downturn in manufacturing activity, with the PMI falling to 49.8, while the services sector showed stronger growth at 51.4 in August. Inflation remains under control with the CPI stable at 2%, although producer price inflation has fallen. The unemployment rate, although stable, is 6.2%, pointing to persistent labour market tightness and still significant wage inflation. The ECB left its policy unchanged, and the deposit rate was maintained at 2%. Interest rate markets fluctuated, with the 10-year T-note at 4.15%, down 8 basis points. US yield curves also shifted, with the 2-10 year curve flattening to 54 points. In the Eurozone, the 10-year Bund rose slightly to 2.71%, while the spread on French bonds stabilised at 66 basis points. Italian bond spreads also tightened to 81 basis points, signalling stable risk perception in this segment. Inflation breakevens showed a slight downward trend, with the 10-year TIPS breakeven rate settling at 2.37%, down 4 basis points. The US inflation swap also fell slightly to 2.56%. On the other hand, the breakeven point for index-linked Bunds was stable (-1 basis point) at 1.74%. Inflation expectations in the Eurozone remained relatively stable at 2%, despite fluctuations in energy prices.

The fund's modified duration was 103% at the start of the period and 100% from 10 September onwards, against a backdrop of German interest rates that fell at the start of the month before returning to their end-August levels at the end of the month. The fund reduced its steepening positions on the German 10/30-year curve. In terms of countries, we continued to reduce our overexposure to Spanish and Italian bonds, and to increase our underexposure to France in light of the rise in French political risk. In Agencies, we were overexposed by 50bp. Lastly, regarding international rates, we took a long position in US interest rates.

At 30 September, the fund's gross YTD performance was 2.23% compared with 2.10% for its benchmark index.

In the short term, uncertainties surrounding Trump's policy combined with disinflation in the Eurozone had a downward impact on rates. On the other hand, German and defence spending plans in the Eurozone create a floor for euro rates. We forecast a German 10-year bond yield of between 2.60% and 2.80% over the coming weeks.

In terms of country allocation, we have a positive stance on peripheral countries due to their solid fundamentals, although spreads remain narrow and uncertainties persist in relation to the trade war with Trump.

The Agencies market is resilient despite economic uncertainties in the EZ, Trump's policy and European defence spending. The tightening of swap spreads that began in 2024 and had continued since the beginning of 2025 has been interrupted since the beginning of April and 'Liberation Day'. Our short-term view is for a stabilisation close to current levels for the German swap spread. In the medium term, however, we believe that the fundamental factors favouring the swap against paper (ample collateral linked to the ECB's QT, government financing needs increased by defence needs and the reform of the debt brake in Germany, in addition to the ECB's interest rate policy (rate cut)) should regain the upper hand. This should favour a tightening of swap spreads in the more medium term.

Calculation of performance during periods of share class inactivity (if applicable)

For periods when certain share classes were unsubscribed or not yet created (the "inactive share classes"), performance is imputed using the actual performance of the fund's active share class which has been determined by the management company as having the closest characteristics to such inactive share class and adjusting it based on the difference in TERs and, where applicable, converting the net asset value of the active share class into the currency of quotation of the inactive share class. The quoted performance for such inactive share class is the result of an indicative calculation.

Illustrative Growth of 10,000

The graph compares the growth of 10,000 in a fund with that of an index. The total returns are not adjusted to reflect sales charges or the effects of taxation, but are adjusted to reflect actual ongoing fund expenses, and assume reinvestment of dividends and capital gains. If adjusted, sales charges would reduce the performance quoted. The index is an unmanaged portfolio of specified securities and cannot be invested in directly. The index does not reflect any initial or ongoing expenses. A fund's portfolio may differ significantly from the securities in the index. The index is chosen by the fund manager.

Risk Measures

The "Summary Risk Indicator" (SRI), as defined by the PRIIPs regulation, is a risk measure based on both market risk and credit risk. It is based on the assumption that you stay invested in the fund for the recommended holding period. It is calculated periodically and may change over time. The indicator is presented on a numerical scale from 1 (the lowest risk) to 7 (the highest risk). The risk measures below are calculated for funds with at least a three-year history.

Standard deviation is a statistical measure of the volatility of the fund's returns.

Tracking Error is reported as a standard deviation percentage difference between the performance of the portfolio and the performance of the reference index. The lower the Tracking Error, the more the fund performance resembles to the performance of its reference index.

The Sharpe ratio uses standard deviation and excess return to determine reward per unit of risk.

The Information Ratio is the difference between the fund's average annualized performance and the reference index divided by the standard deviation of the Tracking Error. The information ratio measures the portfolio manager's ability to generate excess returns relative to the reference index.

Alpha measures the difference between a fund's actual returns and its expected performance, given its level of risk (as measured by beta). Alpha is often seen as a measure of the value added or subtracted by a portfolio manager.

Beta is a measure of a fund's sensitivity to market movements. A portfolio with a beta greater than 1 is more volatile than the market, and a portfolio with a beta less than 1 is less volatile than the market.

R-squared reflects the percentage of a fund's movements that are explained by movements in its benchmark index, showing the degree of correlation between the fund and the benchmark. This figure is also helpful in assessing how likely it is that alpha and beta are statistically significant.

Morningstar Rating and Category

© 2025 Morningstar. All Rights Reserved. The information, data, analyses and opinions ("Information") contained herein (1) include Morningstar's confidential and proprietary information (2) may not be copied or redistributed, (3) do not constitute investment advice (4) are provided solely for informational purposes (5) are not warranted to be complete, accurate or timely and (6) are drawn from fund data published on various dates. The information is provided to you at your own risk. Morningstar is not responsible for any trading decisions, damages or other losses related to the Information or its use. Please verify all of the Information before using it and don't make any investment decision except upon the advice of a professional financial adviser. Past performance is no guarantee of future results. The value and income derived from investments can go up or down. The Morningstar rating applies to funds having at least 3 years of history. It takes into account subscription fee, the yield without risk and the standard deviation to calculate for every fund its ratio MRAR (Morningstar Risk Adjust Return). Funds are then classified in decreasing order by MRAR: first 10 per cent receive 5 stars, the following 22.5 % 4 stars, the following 35 % 3 stars, following 22.5 % 2 stars, the last 10 % receive 1 star. Funds are classified within 180 European categories.

Reference Index

The Sub-Fund is actively managed. The Reference Index is used for comparison purposes only. The Delegated Investment Manager remains free to choose the securities that make up the portfolio in accordance with the Sub-Fund's investment policy.

Asset allocation

Cash offset for Derivatives represents the amount of cash the portfolio manager should borrow if he's Long exposed via derivatives and vice versa. The weighting of the portfolio in various asset classes, including "Other," is shown in this table. "Other" includes security types that are not neatly classified in the other asset classes, such as convertible bonds and preferred stocks. In the table, allocation to the classes is shown for long positions, short positions, and net (long positions net of short) positions. These statistics summarize what the managers are buying and how they are positioning the portfolio. When short positions are captured in these portfolio statistics, investors get a more robust description of the funds' exposure and risk.

Fund Charges: The "All-in Fee" is defined as the aggregate of Management Fees and Administration Fees paid annually by each Sub-Fund, other than taxes (such as "Taxe d'abonnement") and expenses relating to the creation or liquidation of any SubFund or Share Class; the All in Fee shall not exceed such percentage of each Sub-Fund's average daily net asset value as indicated in each Sub-Fund's description under "Characteristics." The All-in Fee paid by each Share Class, as indicated in each Sub-Fund's description, does not necessarily include all the expenses linked to the FCP's investments (such as the tax d'abonnement, brokerage fees, expenses linked to withholding tax reclaims) that are paid by such FCP. Unless otherwise provided for in any Sub-Fund's description, if the yearly actual expenses paid by any Sub-Fund exceed the applicable All-in Fee, the Management Company will support the difference and the corresponding income will be recorded under Management Company fees in the FCP's audited annual report. If the yearly actual expenses paid by each Sub-Fund are lower than the applicable All-in Fee, the Management Company will keep the difference and the corresponding charge will be recorded under Management Company fees in the FCP's audited annual report.

Equity Portfolio Statistics (if applicable)

The referenced data elements below are a weighted average of the long equity holdings in the portfolio. The Price/Earnings ratio is a weighted average of the price/earnings ratios of the stocks in the underlying fund's portfolio. The P/E ratio of a stock is calculated by dividing the current price of the stock by its trailing 12-months' earnings per share. The Price/Cash Flow ratio is a weighted average of the price/cash-flow ratios of the stocks in a fund's portfolio. Price/ cashflow shows the ability of a business to generate cash and acts as a gauge of liquidity and solvency. The Price/Book ratio is a weighted average of the price/book ratios of all the stocks in the underlying fund's portfolio. The P/B ratio of a company is calculated by dividing the market price of its stock by the company's per-share book value. Stocks with negative book values are excluded from this calculation. Dividend Yield is the rate of return on an investment expressed as a percent. Yield is calculated by dividing the amount you receive annually in dividends or interest by the amount you spent to buy the investment.

Fixed-Income Portfolio Statistics (if applicable)

The referenced data elements below are a weighted average of the long fixed income holdings in the portfolio. Duration measures the sensitivity of a fixed income security's price to changes in interest rates. Average maturity is a weighted average of all the maturities of the bonds in a portfolio, computed by weighting each maturity date by the market value of the security. Modified Duration is inversely related to percentage change in price on an average for a specific change in yield. The average coupon corresponds to the individual coupon of each bond in the portfolio, weighted by the nominal amount of these very same securities. The average coupon is calculated only on fixed rate bonds. The Yield to maturity (YTM) reflects the total return of a bond, if the bond is held until maturity, considering all the payments are reinvested at the same rate. This indicator can be calculated at the portfolio level, by weighting the individual YTM by the market value of each bond.

Labels

SRI Label: Created by the French Ministry of Finance in early 2016, with the support of Asset Management professionals, this public Label aims at giving Sustainable Responsible Investment (SRI) management an extra visibility with savers. It will make it easier for investors to identify financial products integrating Environmental, Social, and Governance (ESG) criteria into their investment process. To qualify for certification, funds must satisfy several requirements, including: - Transparency vis-à-vis investors (in terms of investment objectives and process, analysis, portfolio holdings, etc.), - Use of ESG criteria in investment decision making, - Long-term approach to investing, - Consistent voting and engagement policy, - Measured and reported positive impacts. More information on www.lelabelisr.fr

Special Risk Considerations

Counterparty risk: The Fund uses over-the-counter derivatives and/or temporary sales and repurchases of securities. These transactions, undertaken with one or more eligible counterparties, potentially expose the Fund to the risk that one of its counterparties could fail, which could lead to a default in payment.

Credit risk: (the risk of the fund's net asset value falling due to an increase in the yield spreads of private issues in the portfolio, or even a default on an issue), as certain alternative management strategies (interest rate arbitrage, distressed securities, convertible arbitrage and global macro in particular) may be exposed to credit. Increases in the yield spreads of private issues in the portfolio, or even a default on an issue, may cause the fund's net asset value to fall.

Risk related to the commitment on forward financial instruments: The strategies implemented via forward financial instruments are based on the expectations of the management team. If the markets do not evolve in line with the strategies implemented, this could lead to a fall in the Fund's net asset value.

Risk of holding securities with a low or no credit rating: the Fund reserves the right to hold securities with a low or no credit rating. Thus, the use of "high yield securities" (securities with a higher risk of default and higher volatility) may lead to a significant decrease in the net asset value of the Fund.

Please refer to the full prospectus, for additional details on risks.

Natixis Investment Managers International - a portfolio management company authorized by the Autorité des Marchés Financiers (French Financial Markets Authority - AMF) under no. GP 90-009, and a simplified joint-stock company (société par actions simplifiée – SAS) registered in the Paris Trade and Companies Register under no. 329 450 738.
