RISK PROFILE

Lower risk	1	2	3	4	5	6	7	Higher risk
------------	---	---	---	---	---	---	---	-------------

The category of the summary risk indicator is based on historical data.

Due to its exposure to equity markets, the Fund may experience significant volatility, as expressed by its rank on the above scale.

The Fund investment policy exposes it primarily to the following risks:

- Risk of capital loss
- Counterparty risk
- Equity securities
- Exchange Rates
- Financial Derivatives Instruments
- Geographic concentration risk
- Portfolio Concentration risk
- Small and mid cap risk
- Model risk

The Fund is subject to sustainability risks.

For more information, please refer to the section detailing specific risks at the end of this document.

Some recent performance may be lower or higher. As the value of the capital and the returns change over time (notably due to currency fluctuations), the repurchase price of the shares can be higher or lower than their initial price. The performance indicated is based on the NAV (net asset value) of the share class, and is net of all charges applying to the fund but does not account for sale commissions, taxation or paying agent fees, and assumes that dividends if any are reinvested. Taking such fees or commissions into account would lower the returns. The performance of other share classes would be higher or lower based on the differences between the fees and the entry charges. In the periods where certain share classes are not subscribed or not yet created (inactive share classes), performance is calculated based on the actual performance of an active share class of the fund whose characteristics are considered by the management company as being closest to the inactive share class concerned, after adjusting it for the differences between the total expense ratios (TER), and converting any net asset value of the active share class in the currency in which the inactive share class is listed. The performance given for the inactive share class is the result of a calculation provided for information.

Please read the important information given in the additional notes at the end of this document.

⁽¹⁾ Please refer to the prospectus of the fund and to the KID before making any final investment decisions.

ESG analysis as of 30/09/2025

ESG Risk Categories

From lowest to highest risk

	Fund		Reference Index	
	Number of values	Weight (%)	Number of values	Weight (%)
Negligible	13	11.6	17	6.3
Low	73	67.4	118	62.1
Medium	24	21.0	76	28.5
High	0	-	8	3.2
Severe	0	-	0	-
Total	110	100.0	219	100.0

*As some securities do not have an associated ESG risk category, the total may differ by 100%.
An ESG Risk category is assigned only to securities. Cash is excluded and weightings are therefore rebased on the market value of the equities only.*

ESG Risk Categories (%)

Source : Sustainalytics

ESG Risk Category - Reading grid

Negligible: 0-9.99 Negligible financial impact of ESG issues on the portfolio	Low: 10-19.99 Low financial impact of ESG issues on the low portfolio	Medium: 20-29.99 Moderate financial impact of ESG issues on the moderate portfolio	High: 30-39.99 High financial impact of ESG issues on the high portfolio	Severe: > 40 Severe financial impact of ESG issues on the portfolio
---	---	--	--	--

Each category captures a level of material financial impacts driven by ESG factors. The rating is rendered on a 0-100 scale, where lower scores are better, with 0 indicating that a company has no unmanaged ESG Risk.

ESG Risk Rating score

The lower the score, the lower the ESG risk

Fund	Reference Index
15.90	17.66

ESG Risk Rating score

ESG risk ratings are interpreted as a measure of the unmanaged risk faced by companies, which could significantly impact their valuations. The lower a company's ESG risk rating, the lower its overall risk of a significant financial impact due to ESG factors. Sustainalytics' ESG risk ratings are made up of three basic elements which contribute to the overall score: Material ESG issues (or "MEI"), corporate governance and idiosyncratic issues.

The ESG risk rating is comprised of scores for 3 to 9 material ESG issues (out of a possible 20) and a corporate governance score. The indicators analysed on the various material ESG issues include (among others):

- carbon emissions, the use of resources such as water for the Environmental pillar,
- management of human capital through the company's training plans for the Social pillar and
- the quality of management and the integrity of the management committee for corporate governance.

These scores will have different weightings depending on the sub-sector of the company being assessed, as well as its specific risk exposure. Any controversies involving a company are also incorporated into the ESG risk rating so that its performance in the rating is as close as possible to reality. For more information on the methodology used, please get in touch with your usual contact person at Natixis Investment Managers or visit www.sustainalytics.com/esg-ratings/

Carbon emissions (MTCO_{2e})

Coverage rate: 100 %

Carbon emissions. Expressed in Million Tonnes CO_{2e} (MTCO_{2e}), this measure counts greenhouse gas emissions "induced" by the company's activity taking into account direct emissions (scope 1) and indirect emissions related to energy consumption (scope 2). Aggregated at the portfolio level, this measure is the weighted average of the "carbon emissions" of the portfolio's issuers. Scope 3 emission are not taken into account.

Carbon intensity (tCO_{2e} / USD M Sales)

Coverage rate: 100 %

Carbon intensity is the ratio of carbon emissions (Tonne CO_{2e}) to the company's turnover (USD million). Aggregated at the portfolio level, this measure is the weighted average of the "carbon intensities" of the portfolio's issuers.

Calculation of performance during periods of share class inactivity (if applicable)

For periods when certain share classes were unsubscribed or not yet created (the "inactive share classes"), performance is imputed using the actual performance of the fund's active share class which has been determined by the management company as having the closest characteristics to such inactive share class and adjusting it based on the difference in TERs and, where applicable, converting the net asset value of the active share class into the currency of quotation of the inactive share class. The quoted performance for such inactive share class is the result of an indicative calculation.

Illustrative Growth of 10,000

The graph compares the growth of 10,000 in a fund with that of an index. The total returns are not adjusted to reflect sales charges or the effects of taxation, but are adjusted to reflect actual ongoing fund expenses, and assume reinvestment of dividends and capital gains. If adjusted, sales charges would reduce the performance quoted. The index is an unmanaged portfolio of specified securities and cannot be invested in directly. The index does not reflect any initial or ongoing expenses. A fund's portfolio may differ significantly from the securities in the index. The index is chosen by the fund manager.

Risk Measures

The "Summary Risk Indicator" (SRI), as defined by the PRIIPs regulation, is a risk measure based on both market risk and credit risk. It is based on the assumption that you stay invested in the fund for the recommended holding period. It is calculated periodically and may change over time. The indicator is presented on a numerical scale from 1 (the lowest risk) to 7 (the highest risk). The risk measures below are calculated for funds with at least a three-year history.

Standard deviation is a statistical measure of the volatility of the fund's returns.

Tracking Error is reported as a standard deviation percentage difference between the performance of the portfolio and the performance of the reference index. The lower the Tracking Error, the more the fund performance resembles to the performance of its reference index.

The Sharpe ratio uses standard deviation and excess return to determine reward per unit of risk.

The Information Ratio is the difference between the fund's average annualized performance and the reference index divided by the standard deviation of the Tracking Error. The information ratio measures the portfolio manager's ability to generate excess returns relative to the reference index.

Alpha measures the difference between a fund's actual returns and its expected performance, given its level of risk (as measured by beta). Alpha is often seen as a measure of the value added or subtracted by a portfolio manager.

Beta is a measure of a fund's sensitivity to market movements. A portfolio with a beta greater than 1 is more volatile than the market, and a portfolio with a beta less than 1 is less volatile than the market.

R-squared reflects the percentage of a fund's movements that are explained by movements in its benchmark index, showing the degree of correlation between the fund and the benchmark. This figure is also helpful in assessing how likely it is that alpha and beta are statistically significant.

Morningstar Rating and Category

© 2025 Morningstar. All Rights Reserved. The information, data, analyses and opinions ("Information") contained herein (1) include Morningstar's confidential and proprietary information (2) may not be copied or redistributed, (3) do not constitute investment advice (4) are provided solely for informational purposes (5) are not warranted to be complete, accurate or timely and (6) are drawn from fund data published on various dates. The information is provided to you at your own risk. Morningstar is not responsible for any trading decisions, damages or other losses related to the Information or its use. Please verify all of the Information before using it and don't make any investment decision except upon the advice of a professional financial adviser. Past performance is no guarantee of future results. The value and income derived from investments can go up or down. The Morningstar rating applies to funds having at least 3 years of history. It takes into account subscription fee, the yield without risk and the standard deviation to calculate for every fund its ratio MRAR (Morningstar Risk Adjust Return). Funds are then classified in decreasing order by MRAR: first 10 per cent receive 5 stars, the following 22.5 % 4 stars, the following 35 % 3 stars, following 22.5 % 2 stars, the last 10 % receive 1 star. Funds are classified within 180 European categories.

Asset allocation

Cash offset for Derivatives represents the amount of cash the portfolio manager should borrow if he's Long exposed via derivatives and vice versa. The weighting of the portfolio in various asset classes, including "Other," is shown in this table. "Other" includes security types that are not neatly classified in the other asset classes, such as convertible bonds and preferred stocks. In the table, allocation to the classes is shown for long positions, short positions, and net (long positions net of short) positions. These statistics summarize what the managers are buying and how they are positioning the portfolio. When short positions are captured in these portfolio statistics, investors get a more robust description of the funds' exposure and risk.

Fund Charges: The "All-in Fee" is defined as the aggregate of Management Fees and Administration Fees paid annually by each Sub-Fund, other than taxes (such as "Taxe d'abonnement") and expenses relating to the creation or liquidation of any Sub-Fund or Share Class; the All-in Fee shall not exceed such percentage of each Sub-Fund's average daily net asset value as indicated in each Sub-Fund's description under "Characteristics." The All-in Fee paid by each Share Class, as indicated in each Sub-Fund's description, does not necessarily include all the expenses linked to the FCP's investments (such as the tax d'abonnement, brokerage fees, expenses linked to withholding tax reclaim) that are paid by such FCP. Unless otherwise provided for in any Sub-Fund's description, if the yearly actual expenses paid by any Sub-Fund exceed the applicable All-in Fee, the Management Company will support the difference and the corresponding income will be recorded under Management Company fees in the FCP's audited annual report. If the yearly actual expenses paid by each Sub-Fund are lower than the applicable All-in Fee, the Management Company will keep the difference and the corresponding charge will be recorded under Management Company fees in the FCP's audited annual report.

Equity Portfolio Statistics (if applicable)

The referenced data elements below are a weighted average of the long equity holdings in the portfolio. The Price/Earnings ratio is a weighted average of the price/earnings ratios of the stocks in the underlying fund's portfolio. The P/E ratio of a stock is calculated by dividing the current price of the stock by its trailing 12-months' earnings per share. The Price/Cash Flow ratio is a weighted average of the price/cash-flow ratios of the stocks in a fund's portfolio. Price/ cashflow shows the ability of a business to generate cash and acts as a gauge of liquidity and solvency. The Price/Book ratio is a weighted average of the price/book ratios of all the stocks in the underlying fund's portfolio. The P/B ratio of a company is calculated by dividing the market price of its stock by the company's per-share book value. Stocks with negative book values are excluded from this calculation. Dividend Yield is the rate of return on an investment expressed as a percent. Yield is calculated by dividing the amount you receive annually in dividends or interest by the amount you spent to buy the investment.

Fixed-Income Portfolio Statistics (if applicable)

The referenced data elements below are a weighted average of the long fixed income holdings in the portfolio. Duration measures the sensitivity of a fixed income security's price to changes in interest rates. Average maturity is a weighted average of all the maturities of the bonds in a portfolio, computed by weighting each maturity date by the market value of the security. Modified Duration is inversely related to percentage change in price on an average for a specific change in yield. The average coupon corresponds to the individual coupon of each bond in the portfolio, weighted by the nominal amount of these very same securities. The average coupon is calculated only on fixed rate bonds. The Yield to maturity (YTM) reflects the total return of a bond, if the bond is held until maturity, considering all the payments are reinvested at the same rate. This indicator can be calculated at the portfolio level, by weighting the individual YTM by the market value of each bond.

Labels

SRI Label: Created by the French Ministry of Finance in early 2016, with the support of Asset Management professionals, this public Label aims at giving Sustainable Responsible Investment (SRI) management an extra visibility with savers. It will make it easier for investors to identify financial products integrating Environmental, Social, and Governance (ESG) criteria into their investment process. To qualify for certification, funds must satisfy several requirements, including: - Transparency vis-à-vis investors (in terms of investment objectives and process, analysis, portfolio holdings, etc.), - Use of ESG criteria in investment decision making, - Long-term approach to investing, - Consistent voting and engagement policy, - Measured and reported positive impacts. More information on www.lelabelisr.fr

Performance fees

The performance fee applicable to a particular share class is calculated according to an indexed assets approach, i.e. based on a comparison of the valued assets of the UCITS and the reference assets, which serves as a basis for the calculation of the performance fee. The reference period, which corresponds to the period during which the performance of the UCITS is measured and compared to that of the reference index, is capped at five years. The management company shall ensure that, over a performance period of a maximum five (5) years, any underperformance of the UCITS in relation to the reference index is compensated for before performance fees become payable. The start date of the reference period and starting value of the performance reference assets will be reset if underperformance has not been compensated for and ceases to be relevant as the five-year period elapses.

Special Risk Considerations

Risk of capital loss: the net asset value is likely to fluctuate widely because of the financial instruments that make up the Fund's portfolio. Under these conditions, the invested capital may not be fully returned, including for an investment made over the recommended investment period.

Counterparty risk: The Fund uses over-the-counter derivatives and/or temporary sales and repurchases of securities. These transactions, undertaken with one or more eligible counterparties, potentially expose the Fund to the risk that one of its counterparties could fail, which could lead to a default in payment.

Equity securities: Equity securities are volatile and can decline significantly in response to broad market and economic conditions.

Exchange Rates: Some Funds are invested in currencies other than their reference currency. Changes in foreign currency exchange rates will affect the value of those securities held by such Sub-Funds. For unhedged Share Classes denominated in currencies different than the Fund's currency, exchange rate fluctuations can generate additional volatility at the Share Class level.

Financial Derivatives Instruments: Derivatives, such as options, futures and forward contracts, involves risk of loss and may entail additional risks. These include lack of liquidity, possible losses greater than the Fund's initial investment, increased transaction costs, and higher volatility. Option premiums paid for or received by the Fund are small relative to the market value of the investments underlying the options. This means that buying and selling put and call options can be more speculative than investing directly in the securities they represent. Under certain market conditions, the Fund could be forced to sell securities or to close derivative positions at a loss. Because derivatives depend on the performance of an underlying asset, they can be highly volatile and are subject to market and credit risks.

Geographic concentration risk: Funds that concentrate investments in certain geographic regions may suffer losses, particularly when the economies of those regions experience difficulties or when investing in those regions become less attractive. Moreover, the markets in which the funds' invest may be significantly affected by adverse political, economic or regulatory developments.

Portfolio Concentration risk: Funds investing in a limited number of securities may increase the fluctuation of such funds' investment performance. If such securities perform poorly, the fund could incur greater losses than if it had invested in a larger number of securities.

Small and mid cap risk: This is characterised by two main risks: First, a liquidity risk on the securities due to a low market depth associated with the small capitalisation of these companies. In fact, purchases/sales might not be made at the best price within the usual timeframe. Second, there may be fewer financial disclosure requirements for small and mid-cap companies than for large-cap companies. This may have an impact on the analyses carried out on these securities. The realisation of such risks may bring about a decline in net asset value.

Model risk: The UCITS management process is based on developing a systematic model that identifies signals based on past statistical results. There is a risk of the model not being efficient, as there is no guarantee that past market situations will recur in the future.

Sustainability risk: The Fund is subject to sustainability risks as defined in the Regulation 2019/2088 (article 2(22)) by environmental, social or governance event or condition that, if it occurs, could cause an actual or a potential material negative impact on the value of the investment. More information on the framework related to the incorporation of sustainability risks can be found on the website of the Management Company and the Delegated Investment Manager.
